

QUESTIONNAIRE

Latent factors on the design and adoption of gamified apps in primary education

AUTOR UNED
 Esteban Vázquez-Cano

1.- Introducción

This questionnaire has been developed within the framework of the “Proof of Concept” Project entitled: “GAUBI-ORTO. Evaluation of a digital model and application for sustainable, ubiquitous and gamified learning of Spanish spelling in Primary Education” (PDC2022-133185-I00). State Program to Promote Scientific-Technical Research and its Transfer, of the State Plan for Scientific and Technical Research and Innovation. Ministry of Science and Innovation (Spain)

2.- Validity and reliability of the questionnaire

The Cronbach Alpha coefficient was above 0.8 and the Kaiser-Meyer index exceeded 0.78. The null hypothesis was rejected by the Bartlett sphericity test, thus enabling factor analysis. Factor analysis yielded seven factors with the varimax rotation method, thus confirming the validity of the questionnaire. The maximum likelihood estimation method was used to calculate the structural model’s parameters. Although the data did not conform to the multivariate normal distribution, this method facilitated the convergence of estimates (Lévy et al., 2006). The model was assessed on criteria from Bollen (1989) and Rindskopf and Rose (1988), who proposed that the measurement model and structural model be evaluated separately. The measurement model’s validity and reliability were analyzed, the latter in terms of the reliability of the items and of each construct. For validity, both convergent and discriminant validity were analyzed, with the results shown in Tables 1 and 2.

Table 1
Standardized estimations

Factors		λ	Cronbach’s α	CR (Composite Reliability)	AVE
<i>Curriculum Connection</i>					
CC1	Curriculum Con.	0.843	0.923	0.901	0.755
CC2	Curriculum Con.	0.834			
CC3	Curriculum Con.	0.811			
CC4	Curriculum Con.	0.789			
CC5	Curriculum Con.	0.823			
<i>Feedback and Operational Experience</i>					
FO1	Feedback and op. experience	0.787	0.911	0.902	0.814
FO2	Feedback and op. experience	0.866			
FO3	Feedback and op. experience	0.815			
FO4	Feedback and op. experience	0.889			
FO5	Feedback and op. experience	0.811			
FO6	Feedback and op. experience	0.865			
<i>Assessment and Learning analytics</i>					
AL1	Assessment and L. Analytics	0.821	0.944	0.851	0.712
AL2	Assessment and L. Analytics	0.832			
AL3	Assessment and L. Analytics	0.822			
AL4	Assessment and L. Analytics	0.818			
<i>Sustainable (Protection Personal data)</i>					
SP1	Sustainable (Prot. Personal Data)	0.934	0.923	0.944	0.881
SP2	Sustainable (Prot. Personal Data)	0.889			

SP3	Sustainable (Prot. Personal Data)	0.921		
SP4	Sustainable (Prot. Personal Data)	0.896		
SP5	Sustainable (Prot. Personal Data)	0.878		
SP6	Sustainable (Prot. Personal Data)	0.923		
SP7	Sustainable (Prot. Personal Data)	0.899		
<i>Equal access</i>			0.833	0.901
EA1	Equal access	0.887		
EA2	Equal access	0.900		
EA3	Equal access	0.812		
EA4	Equal access	0.834		
EA5	Equal access	0.889		
<i>Flow</i>			0.932	0.901
FL1	Flow	0.911		
FL2	Flow	0.905		
FL3	Flow	0.923		
FL4	Flow	0.907		
<i>Efficacy</i>			0.931	0.919
EF1	Efficacy	0.901		
EF2	Efficacy	0.897		
EF3	Efficacy	0.838		
<i>Satisfaction with of an gamified app</i>			0.948	0.938
SA1	Satisfaction	0.901		
SA2	Satisfaction	0.923		
SA3	Satisfaction	0.971		

Table 1 shows that the reliability of the items is verified. In terms of the reliability of the constructs, all the values for the Cronbach α coefficient and the Composite Reliability (CR) coefficient exceed 0.7, which confirms the reliability of the constructs. Table 1 also shows that the average variance extracted (AVE) is above 0.5, which verifies the constructs' convergent validity. Table 2 presents the results for discriminant validity. For this, the correlation matrix between the constructs was calculated, which confirmed that the correlations were less than the AVE square root.

Table 2
Discriminant validity of measures

	CC	FO	AL	SP	EA	FL	EF	SA
CC	0.878							
FO	0.534	0.814						
AL	0.551	0.605	0.805					
SP	0.612	0.599	0.699	0.855				
EA	0.589	0.556	0.678	0.586	0.871			
FL	0.711	0.587	0.589	0.702	0.555	0.787		
EF	0.721	0.591	0.556	0.713	0.578	0.761	0.791	
SA	0.741	0.731	0.665	0.595	0.798	0.613	0.600	0.901

Note: the bold numbers of the diagonal are the square root of the AVE. Off-diagonal elements are correlations between constructs.

We observed that all correlations between the constructs amount to less than the corresponding AVE values for each construct, thus confirming that the factors measure different concepts. Finally, in assessing the structural model, it was found that the estimated value of the squared coefficient of multiple correlation for each dependent or endogenous construct exceeds 0.5, and that the factor loads between constructs is significant. Table 3 summarizes the structural model and the hypothesis testing results.

Table 3
Parameter estimates

3.- Model and hypotheses

The design of the questionnaire is based on the following research hypotheses:

Hypotheses

Ease-of-use

- H1: Perceived usefulness has a positive effect on attitude towards use of an app.
- H2: Perceived ease-of-use has a positive effect on perceived usefulness.
- H3: Perceived ease-of-use has a positive effect on attitude towards use of the technology.

Attitude

- H4: A positive attitude towards use of the technology has a positive effect on learning efficacy.

Curriculum connection

- H5: Curricular connection influences perceived ease-of-use.
- H6: Curricular connection has a positive effect on learning efficacy.
- H7: Curricular connection has a positive effect on satisfaction.

Assessment and Learning analytics

- H8: The higher the level of vinculation between assessment criteria and gamified challenges, the greater the influence on learning efficacy.
- H9: A higher level of feedback through learning analytics has a positive effect on teachers' satisfaction.

Learning efficacy

- H10: The higher the level of learning efficacy, the stronger the positive influence on teachers' satisfaction.

Satisfaction

Figure 1. Hypotheses and dimensions of the questionnaire.

Figure 2. Model of structural equations specified for the derivation of the importance of attributes.

4.- Selected dimensions and attributes for app design measurement

The questionnaire contained eight categories (six latent variables with 37 items). Each item (1-7 scale, 1 meaning “totally disagree” and 7 “totally agree”).

Category	Dimension	Items	Authors
Curriculum Connection	Curriculum Connection	CC1. An educational gamified app should contemplate the development of specific competencies. CC2. An educational gamified app should contemplate the development of transversal competencies. CC3. An educational gamified app should contemplate the development of curricular contents of one or several subjects. CC4. An educational gamified app should contemplate the development of education in values. CC5. An educational gamified app should integrate learning situations.	Hirsh-Pasek et al. (2015); Lynch & Redpath (2012); Falloon (2013).
Feedback and Operational Experience	Feedback and operational experience on children's game experience and learning	FO1. An educational gamified app should reinforce cognitive functions (informative, completion, corrective, differentiation, restructuring). FO2. An educational gamified app should reinforce metacognitive functions (informative, specification, corrective, guiding). FO3. An educational gamified app should be motivational (incentive, task facilitation, self-efficacy enhancing, and reattribution). FO4. An educational gamified app should promote self-regulated learning and adaptive scaffolding. FO5. An educational gamified app should be based both on individual and collaborative processes. FO6. The educational gamified app has to provide personalised an adaptive feedback to improve students' performance and to support student reflection.	Shute & Ventura (2013); Deterding et al., (2011). Hamari (2017); Buckley & Doyle (2016); Hamari et al. (2016).
Assessment and Learning analytics	Assessment and Learning Analytics	AS1. The overcoming of challenges in the app should be related to the overcoming of the curriculum evaluation criteria. AS2. The educational gamified app has to provide information about students' performance to parents and teachers. AS3. The educational gamified app has to provide tips to parents to help and control students activity in the app. AS4. The educational gamified app has to provide scales of progress.	Lockyer et al. (2013); Admiraal et al. (2020); Almohammadi et al. (2017); Bernhardt (2017); Charitopoulos et al. (2020); Ifenthaler, D. (2021);
Sustainable (Protection Personal data)	Sustainable and protection of personal data	PD1. App informs on the protection of personal data. PD2. App explains why it asks for permission. PD3. App applies an efficient cache policy. PD4. App optimize the use of location services. PD5. App makes decision reversal easy. PD6. App promotes a safe, flexible and collaborative learning environment. PD7. App guarantees transparency (algorithms and processes).	Baker & Hjarlmarson (2019); Regulation (EU) 2016/679; Feiler et al. (2018); Ooijen & Vrabec (2019).
Equal access	Equal access	EA1. App design ensures that everybody has access to all functionalities. EA2. App optimizes media and images. EA3. App implements Zoom/Magnification (resize text). EA4. App is designed in a consistent layout. EA5. App allows keyboard control for touchscreen devices.	Patch et al. (2015); Directive 2016/2102. Caldwell et al. (2008);
Flow	Design and balance	FD1. App should be designed with clear goals. FD2. App should be designed with the implementation of badges, quests, points and levels. FD3. App should be designed with a balance of skill and challenge. FD4. App should be designed with immersive and intrinsically motivated experiences.	Csikszentmihakvi (2014); Brigham (2015); Hamari & Koivisto (2014); Özhan & Kocadere (2020); Wang et al. (2016).
Efficacy	Learning efficacy	EF1. I believe that the use of an educational gamified app can help me to teach with greater efficacy. EF2. I believe that an educational gamified app can help students to acquire more knowledge. EF3. I believe that an educational gamified app increases students' motivation to learn.	Shoukry et al. (2012); Chau (2014); Chiong & Shuler, (2010); Falloon (2013); Chiong (2012); Hanus & Fox (2015).
Satisfaction	Satisfaction with an gamified app	S1. I am satisfied with the use of an educational gamified app to support the teaching process. S2. I am satisfied with the mobile and ubiquitous learning. S3. An educational gamified app satisfies students' learning needs.	DeLone & McLean (2003); Lee (2010); Lee et al. (2009)
